#### 2 Practice round

- Посабмитить задачи каждому человеку.
- Распечатать решение.
- IDE для джавы.
- Сравнить скорость локального компьютера и сервера.
- Проверить int128.
- Проверить прагмы. Например, на bitset.

Чтобы посчитать количество остовных деревьев в неориентированном графе G:

создать матрицу  $N \times N$  mat, для каждого ребра (a,b): mat[a][a]++, mat[b][b]++, mat[a][b]-, at[b][a]-.

Удалить последнюю строку и столбец, взять дискриминант.

Лемма Бернсайда:

Группа G действует на множество X Тогда число классов эквивалентности  $=\frac{\sum_{g\in G}|f(g)|}{|G|},$  где f(g)= число x (из X) : g(x)==x

Число простых быстрее  $\mathcal{O}(n)$ :

dp(n,k) – число чисел от 1 до n в которых все простые  $\geq p[k] \ dp(n,1) = n, \ dp(n,j) = dp(n,j+1) + dp(n/p[j],j),$   $\Rightarrow dp(n,j+1) = dp(n,j) - dp(n/p[j],j)$ 

Если  $p[j], p[k] > \sqrt{n}$ , то dp(n, j) + j == dp(n, k) + k

Делаешь все оптимайзы сверху, но не считаешь глубже dp(n, k), n < K Потом фенвиком+сортировкой подсчитываешь за (K+Q)log все эти запросы Делаешь во второй раз, но на этот раз берешь прекальканные значения

Если  $\sqrt{n} < p[k] < n$ , то (число простых до n) = dp(n,k) + k - 1

$$sum(k = 1..n)k^{2} = n(n+1)(2n+1)/6$$
  

$$sum(k = 1..n)k^{3} = n^{2}(n+1)^{2}/4$$
