2 Practice round

- Посабмитить задачи каждому человеку.
- Распечатать решение.
- IDE для джавы.
- Сравнить скорость локального компьютера и сервера.
- Проверить int128.
- Проверить прагмы. Например, на bitset.

Simpson и Runge2 – точны для полиномов степени <= 3 Runge3 – точен для полиномов степени <= 5

Явный Рунге-Кутт четвертого порядка, ошибка $\mathrm{O}(\mathrm{h}^4)$

 $y' = f(x, y) y_{n+1} = y_n + (k1 + 2 * k2 + 2 * k3 + k4) * h / 6$

Методы Адамса-Башфорта

 $\begin{array}{l} y_n+3 = y_n+2 + h & * (23/12 * f(x_n+2,y_n+2) \\ -4/3 * f(x_n+1,y_n+1) + 5/12 * f(x_n,y_n)) \; y_n+4 \\ = y_n+3 + h & * (55/24 * f(x_n+3,y_n+3) - 59/24 \\ * f(x_n+2,y_n+2) + 37/24 * f(x_n+1,y_n+1) - 3/8 \\ * f(x_n,y_n)) \; y_n+5 = y_n+4 + h & * (1901/720 * f(x_n+4,y_n+4) - 1387/360 * f(x_n+3,y_n+3) + 109/30 \\ * f(x_n+2,y_n+2) - 637/360 * f(x_n+1,y_n+1) + 251/720 * f(x_n,y_n)) \end{array}$

Извлечение корня по простому модулю (от Сережи) 3 <= p, 1 <= a < p, найти $x^2 = a$

1) Если $a^((p-1)/2) != 1$, return -1 2) Выбрать случайный 1 <= i < p 3) $T(x) = (x+i)^((p-1)/2) \mod (x^2 - a) = bx + c$ 4) Если b != 0 то вернуть c/b, иначе к шагу 2)

Иногда вместо того чтобы считать первообразный у простого числа, можно написать чекер ответа и перебирать случайный первообразный.

Иногда можно представить ответ в виде многочлена и вместо подсчета самих к-тов посчитать значения и проинтерполировать

Лемма Бернсайда:

Группа G действует на множество X Тогда число классов эквивалентности = $(\text{sum }|f(g)|\text{ for }g\text{ in }G) \ / \ |G|$ где f(g) = число x (из X) : g(x) == x

Число простых быстрее O(n):

dp(n, k) – число чисел от 1 до n в которых все простые >= p[k] dp(n, 1) = n dp(n, j) = dp(n, j + 1) + dp(n / p[j], j), т. е. dp(n, j + 1) = dp(n, j) - dp(n / p[j], j)

Если p[j], p[k] > sqrt(n) то dp(n,j) + j == dp(n,k) + k Делаешь все оптимайзы сверху, но не считаешь глубже dp(n,k), n < K Потом фенвиком+сортировкой подсчитываешь за (K+Q)log все эти запросы Делаешь во второй раз, но на этот раз берешь прекальканные значения

Если sqrt(n) < p[k] < n то (число простых до n)=dp(n, k) + k - 1

 $\operatorname{sum}(k=1..n)\ k^2=n(n+1)(2n+1)/6 \ \operatorname{sum}(k=1..n)\ k^3=n^2(n+1)^2/4 \$ Чиселки:
